# Token Parameters (ENG)

Crowdsale and Presale issue of tokens

The experience of designing and building data centers shows that the characteristics of the data center depend on the investments in its construction. Therefore, within Crowdsale, financial goals will be outlined that will allow you to understand what technical characteristics can be realized in the data center in accordance with investments (Tier Level, number of racks, possible growth).

The total emission of tokens will be tied to ~ 800,000 ETH, the maximum amount invested in Hydra. Consequently, the maximum issue of tokens for Crowdsale depositors is 4.000.000 tokens. The Executive Committee will receive 20% of the total mass of tokens, which is 1 million HDT, which will be impossible to use, except for voting in TOB.

The Presale stage is designed to raise funds for the initial preparation of the project: project studies to prepare options for data center locations, legal design of the structure, development of management systems on smart contracts, financing of the Presale marketing campaign. The Presale smart contract will be executed separately from the Crowdsale contract - all presale tokens will subsequently be transferred to the main smart contract.

At the Presale stage, the overall goal of the collection is 10.000 ETH, within which a + 100% Early Bird bonus will be applied. Accordingly, the maximum HDT emission at the Presale stage is 100,000 HDT.

Within the framework of the main Crowdsale, for every 1 ETH 5 HDT will be received. In this case, Early Bird bonuses will apply:
1) Within 2 days of launching Crowdsale + 20%
2) during the week + 10%.
